Objects	Python Object
Value	What it holds?
Type	What type of object it is?
Identity	Where the object lives?
Label / Name	Label / pointer to the python object

Immutable type	What CPython pre-builds or shares
int	−5 to 256 inclusive, one object each
bool	exactly one True and one False
None	a single None object
str	single characters (Latin-1) and short identifier-like strings are interned; empty string is shared
bytes	single-byte values 0 to 255, plus the empty bytes
tuple	the empty tuple is a singleton; small freed tuples are recycled via free lists
float	nothing cached by value; only a free list of recycled memory
frozenset	the empty frozenset is shared in recent versions; otherwise none
complex	nothing cached
range	nothing cached

Immutable type	Example values	Mutable type	Example values
int	42, -7, 0, 10**100	list	[1, 2, 3], ["a", "b"], [], [1, "mix", 3.0]
float	3.14, -0.5, 2.0, 1e-9	dict	{"a": 1}, {"name": "Ana", "age": 30}, {}
bool	True, False	set	{1, 2, 3}, {"x", "y"}, set()
complex	3+4j, 2j, complex(1, -2), (0.5+0.5j)		
str	"hello", "a", "", "नमस्ते"	bytearray	bytearray(b"hi"), bytearray([72, 105]), bytearray(5)
tuple	(1, 2, 3), ("x", 5), (), (7,)	deque	deque([1, 2, 3]), deque("abc"), deque(maxlen=5)
frozenset	frozenset({1, 2}), frozenset("ab"), frozenset()	array	array("i", [1, 2, 3]), array("f", [1.5, 2.5])
bytes	b"hi", b"\x00\xff", bytes(3)	user class instance	Point(1, 2), Dog("Rex"), Account(balance=100)
range	range(10), range(2, 20, 2)		
None	None (the only value of NoneType)		

```python
print(bool(0))
print(bool([]))
print(bool(""))
print(bool(None))

x = 5
y = x
print(x == y)
print(x is y)  #identity operator is / is not

print("Aswath and s present or not ? :", "swa" in "Aswath") # membership operator in not in
```

```python
print(bin(5))
print(hex(10))
```
